Community Participation

The Dubuque City Council meets on the first and third Monday of each month in the City Council Chambers on the second floor of the Historic Federal Building at 350 West 6th Street. Meetings begin at 6:30 p.m. and are broadcast live on CityChannel, Dubuque’s local government access channel (97.2 digital, 8 analog) on the Mediacom cable system. Meetings are also streamed live and archived on the City website, www.cityofdubuque.org/media. For agenda and minutes information, visit www.cityofdubuque.org/citycouncil or contact the City Clerk’s Office at 563.589.4120 or cityclerk@cityofdubuque.org.

Special Health Information

Thanks to the Safe Drinking Water Act, the United States has the safest water supply and distribution system in the world. However, if you have special health requirements, you should know some people may be more vulnerable to contaminants found in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 800.426.4791.

Water Sources

The Dubuque Water Department obtains water from two groundwater aquifers. The Alluvial aquifer is considered to be highly susceptible to contamination, while the Cambrian-Ordovician aquifer has a low degree of susceptibility to contamination. Every aquifer has a degree of susceptibility to contamination because of the characteristics of the aquifer, overlying materials, and human activity. Susceptibility to contamination generally increases with shallower aquifers, increasing permeability of the aquifer and overlying material, nearby development or agricultural activity, and abandoned or poorly maintained wells. A detailed evaluation of your source water was completed by the Iowa Department of Natural Resources, and is available on our website at www.cityofdubuque.org/water. You may also call 563.589.4291 to obtain a copy of the report.

Water Quality Report

2013
**Purpose of the Water Quality Report**

The City of Dubuque Water Department is proud to present you with our annual water quality report. We are dedicated to producing drinking water that meets or exceeds all state and federal drinking water standards. The purpose of this report is to provide you with information about your drinking water and comply with the United States Environmental Protection Agency (EPA) reporting requirements.

Through the federal Safe Drinking Water Act (SDWA), the U.S. Environmental Protection Agency (EPA) sets national limits for hundreds of substances in drinking water and also specifies various treatments that water systems must use to remove these substances. Each system continually monitors for these substances and reports to the EPA whether any were detected in the drinking water. The EPA uses this data to ensure that consumers are receiving clean water and to verify that states are enforcing laws that regulate drinking water.

This publication conforms to the SDWA requirement that water utilities annually provide detailed water quality information to each of their customers. We are committed to providing you with this information about your water supply because customers who are well informed are our best allies in supporting improvements necessary to maintain the highest drinking water standards.

For more information about this report, or for any questions relating to your drinking water, please contact Bob Green, Water Department Manager, at 563.589.4291 or Jacqueline Rodriguez, Water Plant Manager, at 563.589.4290 or Michael Brekke, Distribution Supervisor, at 563.589.4303.

---

**2012 Drinking Water Summary**

The City of Dubuque Water Department is proud of the high quality of our water supply, which meets all state and federal drinking water quality requirements. We are pleased to inform you that Dubuque had no drinking water violations for 2012. The table to the left lists substances that were detected in our water. Some of these substances have maximum contaminant levels (MCLs) established by the Safe Drinking Water Act. The EPA also requires us to monitor for certain unregulated substances while they consider whether or not to enforce limits on them. Testing is not required for each parameter every year. For more information concerning our drinking water, please contact the Eagle Point Water Treatment Plant at 563.589.4291 or jrodrigu@cityofdubuque.org, or by mail at 1902 Hawthorne Street, Dubuque, IA 52001.

**Information Concerning Lead**

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Dubuque Water Department is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been in service for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 800.426.4791 or at www.epa.gov/lead/waterlead.

The Dubuque Water Department sampled 68 sites for lead in 2012. The results indicated that one sample exceeded the Action Level. According to EPA regulations, utilities must have 90% of their lead samples below the Action Level. Ninety-nine percent of the samples taken were in compliance with this regulation.

---

**Table Definitions**

**AL (Action Level):** The concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system must follow. Amount Detected: This column represents an average of sample results data collected during the reporting year.

**MCL (Maximum Contaminant Level):** The highest level of a contaminant that is allowed in drinking water.

**MCLG (Maximum Contaminant Level Goal):** The level of a contaminant in drinking water below which there is no known or expected risk to health. This column represents a range of individual sample results, from lowest to highest, that were collected during the reporting year.

**SGL:** Single Monitoring Period Sample

**Substances Found in Drinking Water**

To ensure that tap water is safe to drink, the EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of certain contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline at 800.426.4791 or at www.epa.gov/lead/waterlead.

Public water systems and water bottlers use a variety of water sources. These sources include rivers, lakes, ponds, reservoirs, springs, and groundwater wells. As water travels over the surface of the land or through the ground, it can acquire naturally occurring inorganic and organic contaminants, as well as pathogenic microorganisms, which may come from various sources such as agriculture, urban storm water runoff, and residential sites. Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wild life. Substances that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wild life.
- **Inorganic contaminants**, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from sources such as agriculture, urban storm water runoff, and residential sites.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from garbage dumps, industrial waste disposal sites, oil and gas production, mining, or farming.
- **Radionuclides**, which can be naturally occurring or be the result of oil and mining activities.
