Our Commitment to You

The City of Dubuque Water Department is proud to present you with our annual water quality report. We are dedicated to producing drinking water that meets or exceeds all state and federal drinking water standards. The purpose of this report is:

- **To provide you with information about your drinking water.**
- **To comply with the United States Environmental Protection Agency (EPA) reporting requirements.**

We continually strive to adopt new and better methods of delivering the best quality drinking water to you. As regulations and drinking water standards change, it is our commitment to you to incorporate these changes system-wide in an expeditious and cost-effective manner.

We have summarized information about your water supply sources, the water facilities that deliver water to your tap, and the quality of your drinking water. As new challenges to drinking water safety emerge, we will be diligent in maintaining our objective of providing quality drinking water at an affordable price. If you have any health concerns relating to the information in this report, we encourage you to contact your health care provider. For more information about this report, or for any questions relating to your drinking water, please contact Bob Green, Water Department Manager (563-589-4291) or Jacqueline Vanek, Water Plant Manager (563-589-4290), or by e-mail at jvanek@cityofdubuque.org.

Water Sources

The City of Dubuque Water Department has always obtained its drinking water from wells. There are five shallow and four deep wells in service. All wells yield a very high-quality water but the shallow wells are used as the primary source since they are more energy efficient.

The shallow alluvial wells are located on the Hawthorne Street boat ramp peninsula of the Mississippi River, now called A.Y. McDonald Park. A hydrological study found that their recharge water actually comes from the underlying bedrock aquifers despite their close proximity to the river. Well depths vary from 127 feet to 200 feet and all are cased to 100 feet. Individual well capacities range from 1.55 to 3.30 million gallons daily (MGD) and the theoretical combined capacity of all five wells is 14.15 MGD.

The four deep wells are located within a 1500 foot radius of the treatment plant. These wells are all cased to 500 feet and individual well depths vary from 1560 feet to 1800 feet. The Cambrian aquifer system is their primary source of water. The theoretical combined capacity of the deep wells is 9.6 MGD and individual well production range from 0.9 to 3.25 MGD.

The City of Dubuque obtains a portion of its water from the Cambrian-Ordovician and Cambrian aquifers. These aquifers were determined to be not susceptible to contamination because the characteristics of the aquifers and overlying materials prevent easy access of contaminants to the aquifers. A detailed evaluation of our source water was completed by the Iowa Department of Natural Resources, and is available from The City of Dubuque Eagle Point Water Plant (563-589-4291).
**Aeration.** Raw or untreated water is drawn from wells into the City’s treatment plant and is cascaded down through a series of trays, increasing the surface area of the water and promoting the exchange of gases. Aeration also removes undesirable gases such as radon. Aeration is similar to the natural process that occurs when a stream flows through rapids or over falls.

**Flocculant Aid Addition.** An anionic flocculant aid is added just after aeration. The flocculant helps to improve the clarity of the water by allowing fine particles to clump together and settle out.

**Softening.** Calcium oxide (lime) is mixed with water to form slaked lime. This slaked lime is then added to the water to soften or reduce the minerals that typically make water “hard”. Excessive hardness increases soap use, deposits scale in water heaters and boilers, interferes with some industrial processes and sometimes gives water an unappealing taste and odor. The by-products from the softening process are applied to farmland as a soil conditioner.

**Recarbonation.** The addition of slaked lime increases the pH of the water to about 10. In order to stabilize the softened water, the pH must be lowered. This pH reduction is accomplished by adding carbon dioxide until the pH is approximately 9.3.

**Chlorination.** Chlorine is added to disinfect the water. The chlorine helps ensure our water’s microbiological safety by destroying disease-causing organisms.

**Filtration.** Water is then passed through a sand and gravel filter bed, removing any remaining suspended matter.

**Fluoridation.** Fluoride is added to help prevent tooth decay.

**Phosphate Addition.** Phosphate is added to chemically stabilize the water and lessen the possibility that lead will leach out of pipes and into tap water.

**Reserves.** Water not immediately consumed flows into storage tanks for use when demand exceeds plant pumpage. Water stored in elevated tanks helps stabilize pressure in the distribution system and serves as an emergency reserve for fire protection.

**Distribution.** Finished water is pumped directly into the water distribution systems that serve homes and businesses throughout the city of Dubuque.

---

**Treatment Process**

![Treatment Process Diagram]

**Diagram Notes:**
- **Aeration:** Raw water enters the treatment plant and is aerated, increasing surface area and exchanging gases.
- **Flocculant Aid:** Added after aeration to clump particles for easier settling.
- **Softening:** Calcium oxide is added to reduce hardness, making water more suitable for household use.
- **Recarbonation:** Carbon dioxide is added to adjust pH after softening.
- **Chlorination:** Chlorine disinfects water, ensuring microbiological safety.
- **Filtration:** Water is passed through filters to remove any remaining particles.
- **Fluoridation:** Fluoride is added to promote tooth health.
- **Phosphate Addition:** Phosphate is used to stabilize water and prevent leaching of lead.
- **Reserves:** Water storage tanks prepare for demand spikes.
- **Distribution:** Finished water is directed to household systems.
2007 Drinking Water Summary

The City of Dubuque Water Department is proud of the high quality of our water supply, which meets or exceeds all state and federal drinking water quality requirements. We are pleased to inform you that Dubuque had no drinking water violations for 2007. The table below lists substances that were detected in our water. Some of these substances have maximum contaminant levels (MCLs) established by the Safe Drinking Water Act. The EPA also requires us to monitor for certain unregulated substances while they consider whether or not to enforce limits on them. Testing is not required for each parameter every year, some parameters listed below were detected in previous years’ testing. For more information concerning your drinking water, please contact the Treatment Plant by phone at (563) 589-4291, by e-mail at wtrplnt@cityofdubuque.org or by mail at 1902 Hawthorne Street, Dubuque, IA 52001.

Table Definitions:

**Action Level (AL):** The concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system must follow.

**Amount Detected:** This column represents an average of sample result data collected during the reporting year. In some cases, it may represent a single sample if only one sample was collected.

**Maximum Contaminant Level (MCL):** The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology.

**Maximum Residual Disinfectant Level Goal (MRDLG):** The level of a drinking water disinfectant below which there is no known or expected risk to health.

**N/A:** Not Applicable.

**ND:** Not detectable at testing limits.

**P/A:** Presence Absence test.

**ppb:** Parts per billion (or micrograms per liter).

**ppm:** Parts per million (or milligrams per liter).

**RAA:** Running Annual Average.

**Range (Low - High):** This column represents a range of individual samples results, from lowest to highest, that were collected during the reporting year.

**TCR:** Total Coliform Rule.

**Maximum Contaminant Level Goal (MCL):** The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLs allow for a margin of safety.

**Maximum Residual Disinfectant Level (MRDL):** The highest level of a disinfectant allowed in drinking water.
Substances Found in Drinking Water

To ensure that tap water is safe to drink, the EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline (800-426-4791).

Public water systems and water bottlers use a variety of water sources. These sources include rivers, lakes, ponds, reservoirs, springs, and groundwater wells. As water travels over the surface of the land or through the ground, it can acquire naturally occurring minerals, radioactive material (if present), and can pick up substances resulting from the presence of animals or from human activity. Substances that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from sources such as agriculture, urban storm water runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial, processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive contaminants**, which can be naturally occurring or be the result of oil and mining activities.

Information Concerning Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Dubuque Water Department is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (800-426-4791) or at www.epa.gov/safewater/lead.

Working Hard for You

Through the federal Safe Drinking Water Act (SWDA), the U.S. Environmental Protection Agency (EPA) sets national limits for hundreds of substances in drinking water and also specifies various treatments that water systems must use to remove these substances. Each system continually monitors for these substances and reports to the EPA if the substances are detected in the drinking water. The EPA uses this data to ensure that consumers are receiving clean water and to verify that states are enforcing laws regulating drinking water.

This publication conforms to the SDWA requirement that water utilities annually provide detailed water quality information to each of their customers. We are committed to providing you with this information about your water supply because customers who are well informed are our best allies in supporting improvements necessary to maintain the highest drinking water standards.

Community Participation

The Dubuque City Council meets the first and third Monday of each month in the Council Chambers on the second floor of the Historic Federal Building at 350 West 6th Street. The meetings begin at 6:30 p.m. and are broadcasted live on CityChannel 8, Dubuque’s local government access channel on the Mediacom cable system. In the event of a holiday, meetings are held on the following Tuesday. Please feel free to participate in these meetings or call Bob Green, Water Department Manager (563-589-4291) for more information. For additional information, visit the city’s website at www.cityofdubuque.org.
